

## How to Get the Most Out of Your Winter Annuals

**Dr. Dennis Hancock**

Extension Forage Specialist  
Crop and Soil Sciences – UGA

## Winter Grazing: Our Competitive Advantage

Photo: Winter grazing on at the UGA Tifton beef cow pastures.

## Winter Annual Forage Quality

Species	Crude Protein	Total Digestible Nutrients	Annual Yield* lbs DM/acre
	----- % -----	-----	
Ryegrass	10-20	56-74	10,630
Oats	8-14	55-70	7,100
Wheat	8-14	52-70	7,110
Rye	8-14	50-70	4,850
Arrowleaf	14-17	56-75	3,470
Crimson	14-16	57-75	3,570

Quality ranges are approximate and are highly dependant upon forage maturity at grazing/harvest. Yields are 3-yr averages from GA and AL.

## Winter Annual Grasses Differ in Forage Distribution

**Dr. Dennis Hancock**

Assoc. Professor and State Forage Extension Specialist  
Univ. of Georgia

## Oats

<b>Adaptation</b>	South and central GA. Soil pH should be kept above 6.0 for best results.
<b>Maturity</b>	Early (if planted early); Late (if grown for hay)
<b>Cold Tolerance</b>	Poor
<b>Problems</b>	Oat can be winterkilled in some years. If grazed early, later growth is very poor.
<b>Varieties</b>	Horizon 201, SS76-40, and RAM LA99016.

## Rye (cereal rye)

<b>Adaptation</b>	Entire state. More tolerant of soil acidity than oat or wheat.
<b>Maturity</b>	Early to very early
<b>Cold Tolerance</b>	Excellent
<b>Problems</b>	Rye will mature quickly and quality may decline fast. Timely grazing or harvest management will be required.
<b>Varieties</b>	AGS104, Bates, Wrens Abruzzi <b>Early:</b> FL 401 (CP)

## Wheat

<b>Adaptation</b>	Entire state. Not tolerant of soil acidity.
<b>Maturity</b>	Medium late
<b>Cold Tolerance</b>	Good
<b>Problems</b>	Late as ryegrass, but not as high yielding.
<b>Varieties</b>	AGS 2038, Oglethorpe (P,M), Roberts (P,M), and SS8641

**Dr. Dennis Hancock**

Assoc. Professor and State Forage Extension Specialist  
Univ. of Georgia

**Dr. Dennis Hancock**  
Assoc. Professor and State Forage Extension Specialist  
Univ. of Georgia

## Annual Ryegrass

<b>Adaptation</b>	Entire state. Tolerates poor drainage and close grazing. Soil pH should be kept above 6.0 for best results.
<b>Maturity</b>	Late
<b>Cold Tolerance</b>	Good
<b>Problems</b>	Interferes with bermudagrass emergence mechanism: (?) competition, luxury K uptake, allelopathy

## Annual Ryegrass

<b>Varieties</b>	Attain, Big Boss, Diamond T (CP), Early Ploid (CP), Fria (M), Jackson (CP), Marshall**, Nelson, Prine, TAMTBO, and Winterhawk (P, M)
------------------	--------------------------------------------------------------------------------------------------------------------------------------

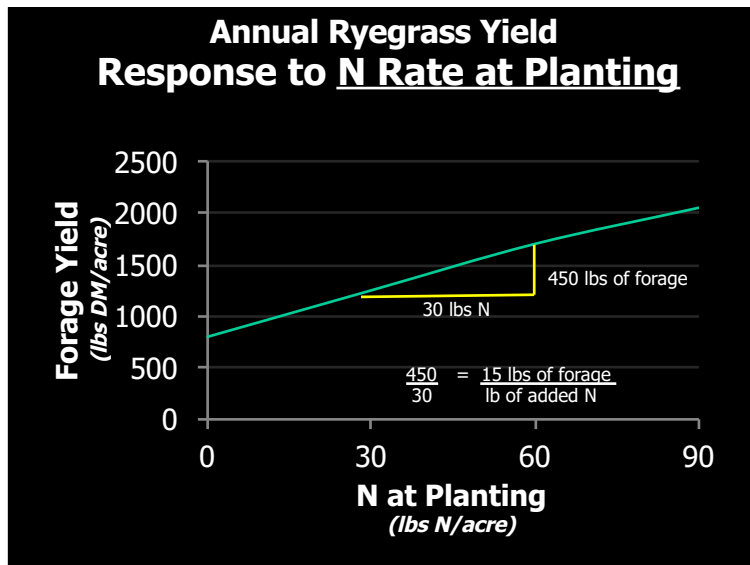

\*\* Highly susceptible to crown rust.

### Cost Implications of Different Nitrogen Response Rates

Nitrogen Response lbs of DM/lb of N	Cost of N, \$/lb of N			
	\$0.50	\$0.60	\$0.75	\$1.00
5	----- \$/lb of DM -----			
10				
15				
20				
25				
30				
35				
40				
45				
50				
55				

**Dr. Dennis Hancock**  
 Assoc. Professor and State Forage Extension Specialist  
 Univ. of Georgia

## Nitrogen Response: Rules of Thumb

Forage Type	N Response Above Critical Level*		
	Early Season	Mid-Season	Late-Season
	----- lb of DM/lb of N added -----		

\* N fertilization above an annual ~40, 50, or 25 lbs of N/acre for Coastal, Tifton 85, and ryegrass, respectively.

## Root Mass: Soil-Building?

## Improvement in soil OM in 3 paddocks located in a pasture-based dairy in Wrens, GA. (2007-2009)

Paddock	Initial	1 year	2 years	3 years
----- Soil Organic Matter, % -----				
P4	1.08			
P8	1.01			
P14	1.14			
Avg.	1.07			

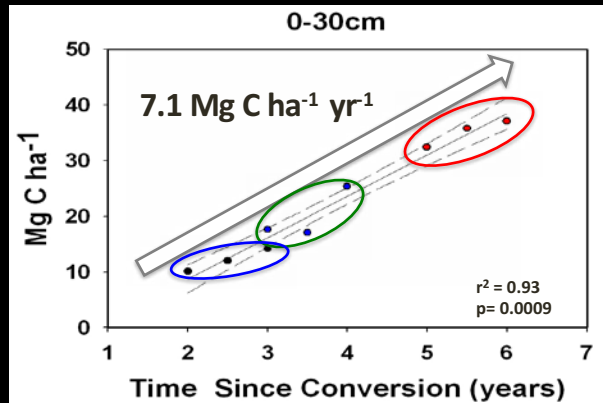

3 years after grazing system started, averaging an inc. in soil OM of 0.35 percentage points per year!!!

**Dr. Dennis Hancock**

Assoc. Professor and State Forage Extension Specialist  
Univ. of Georgia

## Impact of Pasture-Based Livestock on Soil Carbon (Soil OM)

## Other Winter Annuals

## Forage Turnips

**Dr. Dennis Hancock**

Assoc. Professor and State Forage Extension Specialist  
Univ. of Georgia

## Turnips (*Brassica rapa*)

- Bushy tops and large roots (bulbs)
  - High in carbohydrates
- Seeding rate = 1-3 lbs/ac
- Vary in partitioning of tops to bulbs
  - 90:10 – 15:85
- Quick to grazing:
  - 60-90 DAP
- Usually grazed 1-2 times for tops and once for bulbs

Photo credit: <http://www.anassizeed.com/> (top)  
<http://www.ampacseed.com/> (bottom)

## Leafy Turnips and Hybrids (*Brassica campestris* spp.)

- Usually crosses of turnips and oriental vegetables.
- Grazing begins earlier than forage rape
  - 45-75 DAP
- Seeding rate, 1-3 lbs/ac

Photo credit: <http://www.brightseeds.co.uk/>

GRASS

Photos: Dave Robinson, 2010 Midwest Cover Crop Council Meeting <http://bit.ly/1aGIX0n>

## Forage rape (*Brassica napus*)

- Ready to graze after 60-120 d.
  - At least 60 d before first grazing
  - 30 d before 2<sup>nd</sup> grazing.
- 3-4 lbs seed/ac
- Two types:
  - Leafy and upright
  - Dwarf that is short and branched.
- Develop reddish top when ready to graze.

Photo credit: <http://www.brightseeds.co.uk/>

GRASS

**Dr. Dennis Hancock**

Assoc. Professor and State Forage Extension Specialist  
 Univ. of Georgia

## Kale (*Brassica oleracea*)

- Excellent winter hardiness
  - Down to 10° F
  - Excellent grazing into winter
- 3-4 lbs seed/ac
- Two types:
  - Narrow stem (up to 60" tall, 2" stem)
  - Stemless (up to 25")
- Later maturing
  - First grazing may be 90-120 DAP
- Can be conserved as baleage ("kaleage")

Photo credit: <http://www.auswestseeds.com.au/> (top)  
<http://www.limadrain.co.uk/> (bottom)

## Swede (*Brassica napus*)

- More commonly grown where winters are cold and summers are wet.
- 1-3 lbs seed/ac
- Larger bulbs than turnips
- Slower to mature (20-24 wk)
- Usually only grazed after reaching maturity.
- Not recommended in Georgia

Photo credit: <http://oleadell.breezenroup.net/> (top)  
<http://www.scri.ac.uk/> (bottom)

## Forage or "Tillage" Radish (*Raphanus sativus*)

- Partitions more energy to root than shoots
- Impressive root, but...
  - questionable as to impact on and practicality in forage systems.

Photos: Dave Robinson, 2010 Midwest Cover Crop Council Meeting <http://bit.ly/1nGIXOn>

Tillage radish may or may not breakthrough the compacted zone

### Brassicas (Turnips, Hybrids, Forage Rape, Kale, Swede, Radish)

**BENEFITS:**

- Fast establishing, winter hardy forage crop.
- Early planted (late summer-early fall)
- Ready to graze after 60-120 d.
- Very high quality
  - TDN: 65-80% (tops); 75-85% (bulbs)
  - CP: 15-25% (tops); 9-16% (bulbs)
  - Rapid passage rate. Pair with high fiber source.
- High weight gains (1.8 – 2.6 lbs/hd/d)

**Dr. Dennis Hancock**

Assoc. Professor and State Forage Extension Specialist  
 Univ. of Georgia

**Brassicas** (Turnips, Hybrids, Forage Rape, Kale, Swede, Radish)

**BENEFITS:**

- Aggressive growth competitive with weeds
- Tap root of some brassicas can help break through compaction or pans
- Naturally contain glucosinolates
  - Wards off many insect pests
  - Inhibits take-all disease (*Gaeumannomyces graminis* var. *tritici*)
  - Natural nematicide ("biofumigant")
  - Nitrification inhibitor
- Great renovation tool!

Photo credit: Philip Brown, USDA-NRCS Georgia

**Brassicas** (Turnips, Hybrids, Forage Rape, Kale, Swede, Radish)

**CHALLENGES:**

- Requires pH of 6.0-6.8 and well-drained soil.
- Not for overseeding! Does not tolerate much residue and tolerates NO competition from sod.

Photo credit: Philip Brown, USDA-NRCS Georgia

**Dr. Dennis Hancock**

Assoc. Professor and State Forage Extension Specialist  
Univ. of Georgia

## Brassicas (Turnips, Hybrids, Forage Rape, Kale, Swede, Radish)

### CHALLENGES:

- Animal health issues (usually because of sharp change in diet)
  - High in S, so polioencephalomalacia can develop
  - Pure brassica diet can lead to hemolytic anemia/goiter
  - Glucosinolates can cause metabolic problems and taint milk (possibly meat?).
    - Forage types are generally low

Photo credit: Philip Brown, USDA-NRCS Georgia

## Brassica Fertilization

### N Fertility

- Turnips and hybrids and forage rape
  - 40-50 lbs at planting, 30-40 lbs after first grazing
- Kale and Swedes
  - Up to 60 lbs at planting, 30-60 lbs 10-12 weeks after planting (if good grazing potential)

### P & K Fertility

- Based on soil test recommendations
- Kale and swede use up to 2x the P & K of others

Photo credit: Philip Brown, USDA-NRCS Georgia

## Increasing Yields by 15-20% with Plant Growth Regulators?
